

# WHAT IS A BIOBAG?

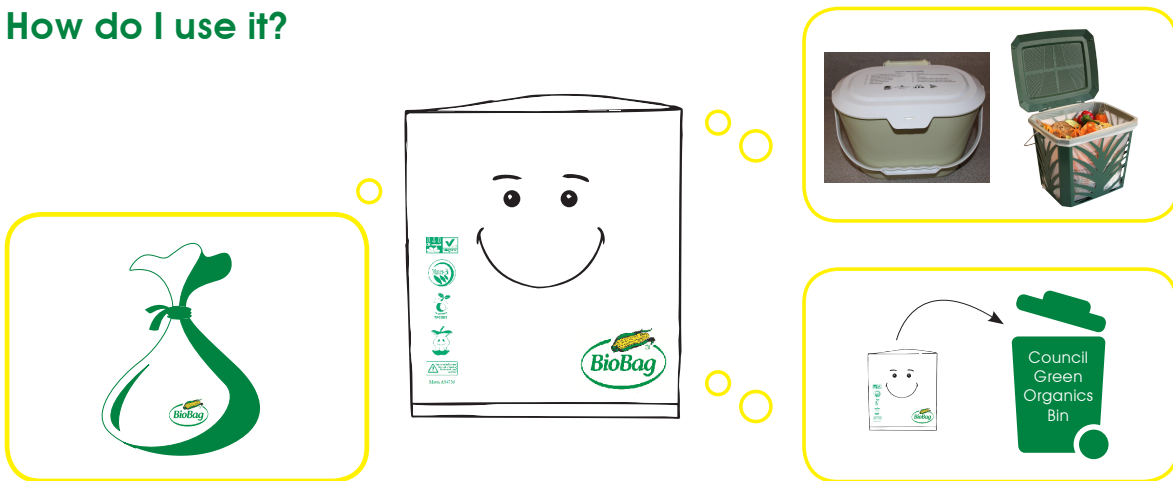

## What is it?

A bag made from corn starch so just like corn it breaks down in compost. Years of research have allowed for the production of a bag that not only breaks down fast in compost to become plant food but allows it to keep on the shelf for about 2 years without losing much strength.

## How do I use it?

Like any other bag it can be used to carry things but it gets better... You can put all your kitchen scraps and any organic waste item in there and put it out with the green waste in the Council green bin or in your home compost bin\*.

TIP - ASK YOURSELF - DID IT GROW? If so...It can go in the Biobag and out into the compost.

\*proper home composting sometimes can be tricky and certain organic items like meat are not recommended to be composted at home, if unsure please seek advice from a composting expert.

## Why BioBag?
